

Sprint Build 3

The Action Layer

Ship Day

2 hours | Live build | Real sends | Real bookings | Proof

#MyAIChiefOfStaff

What We're Shipping Today

1. Task Logger

task_logger.py — log_action() records every Send and Book Meeting to action_log.json

2. Polished Export Proof

Combined proof: approved drafts + sent confirmations + booked meetings + full action log

3. End-to-End Demo

Instructor ships live: fetch → triage → draft → approve → send + book → show proof

The Full Pipeline

Every node is a function you wrote. Today we add LOG and upgrade EXPORT.

New in Sprint Build 3: LOG (writes to action_log.json) and EXPORT (shows log + proof).

```
action_log.json record:
{ "timestamp": "2026-06-21T10:34:00", "action_type": "sent",
  "thread_subject": "Q3 Roadmap Review", "detail": "alice@example.com",
  "id": "msg_abc123" }
```

Task Logger

task_logger.py — three functions, zero new dependencies

```
def log_action(action_type, thread_subject,
               detail, action_id):
    record = {
        "timestamp": datetime.now().isoformat(),
        "action_type": action_type,
        "thread_subject": thread_subject,
        "detail": detail,
        "id": action_id,
    }
    log = _read_log_raw()
    log.append(record)
    with open(LOG_FILE, 'w') as f:
        json.dump(log, f, indent=2)

def get_action_log():
    return _read_log_raw()

def clear_log():
    with open(LOG_FILE, 'w') as f:
        json.dump([], f)
```

Where it gets called:

Send button handler:

```
if result["id"]:
    log_action(
        "sent",
        thread["subject"],
        recipient,
        result["id"]
    )
```

Book Meeting handler:

```
if event["id"]:
    log_action(
        "booked",
        thread["subject"],
        meeting_info["title"],
        event["id"]
    )
```

Wiring It Together

Two call sites in app.py. Both inside the Approval Gate phase.

After Send (in Send button handler)

```
result = send_reply(thread_id, body, recipient)
if result and result.get("id"):
    log_action("sent", thread["subject"],
              recipient, result["id"]) # <-- NEW
    st.success(f"Sent! {result['id']}")
```

After Book Meeting (in Book Meeting handler)

```
event = create_event(title, start, end, attendees)
if event and event.get("id"):
    log_action("booked", thread["subject"],
              meeting_info["title"], event["id"]) # <-- NEW
    st.success(f"Booked! {event['id']}")
```

The Export Proof

The combined proof document: everything in one place.

Approved Drafts

Original thread (left) vs approved AI draft (right) for every approved thread

Sent Email Confirmations

Action log entries with `action_type = 'sent'` — recipient, message_id, timestamp

Booked Meeting Details

Action log entries with `action_type = 'booked'` — meeting title, event_id, timestamp

Full Action Log

Markdown table (or styled HTML table) — every action in chronological order

Download as `.md` (paste anywhere) or `.html` (open in browser for the screenshot).

Live Demo

Watch the instructor do it cold on real Gmail.

1. Switch source to Gmail (engine.py)
2. Click Run Full Pipeline — watch fetch → triage → draft
3. Open Approval Gate — approve a draft, click Send
4. Click Book Meeting on a thread with a meeting request
5. Navigate to Export Proof — show the action log
6. Download the combined proof file

Your Turn — Build Checklist

15 minutes. Work in order. Ask in chat if stuck.

[] streamlit run app.py — confirm app loads

[] Click Run Full Pipeline — confirm pipeline completes

[] Approval Gate: approve a draft, click Send

[] Approval Gate: click Book Meeting on a thread

[] Export Proof: see action log section with your entries

Badge requirement: proof screenshot posted with #MyAIChiefOfStaff

Proof Format — What to Record

Screen Recording (Option A)

1. Sidebar showing 'Run Full Pipeline'
2. Click — watch pipeline run
3. Approval Gate: click Send
4. Book Meeting (if applicable)
5. Export Proof: show action log
6. Download proof, open the file

Screenshots (Option B)

1. Approval Gate with Send/Book buttons visible
2. Success message after Send or Book
3. Export Proof showing action log
4. Downloaded proof file open

Caption Template:

"My AI Chief of Staff just sent a real email and booked a real meeting — fully automated. Built with Python, Gmail API, Google Calendar API, and Gemini. Sprint Build 3: The Action Layer. [attach proof screenshot] #MyAIChiefOfStaff"
